

MLOPS PILOT INTEGRATION WITH MLFLOW

Office of Compensation & Working
Conditions

Sponsor: David Oh – Data Scientist

REMY STEWART

Cornell University
PhD Candidate in Sociology &
Information Sciences

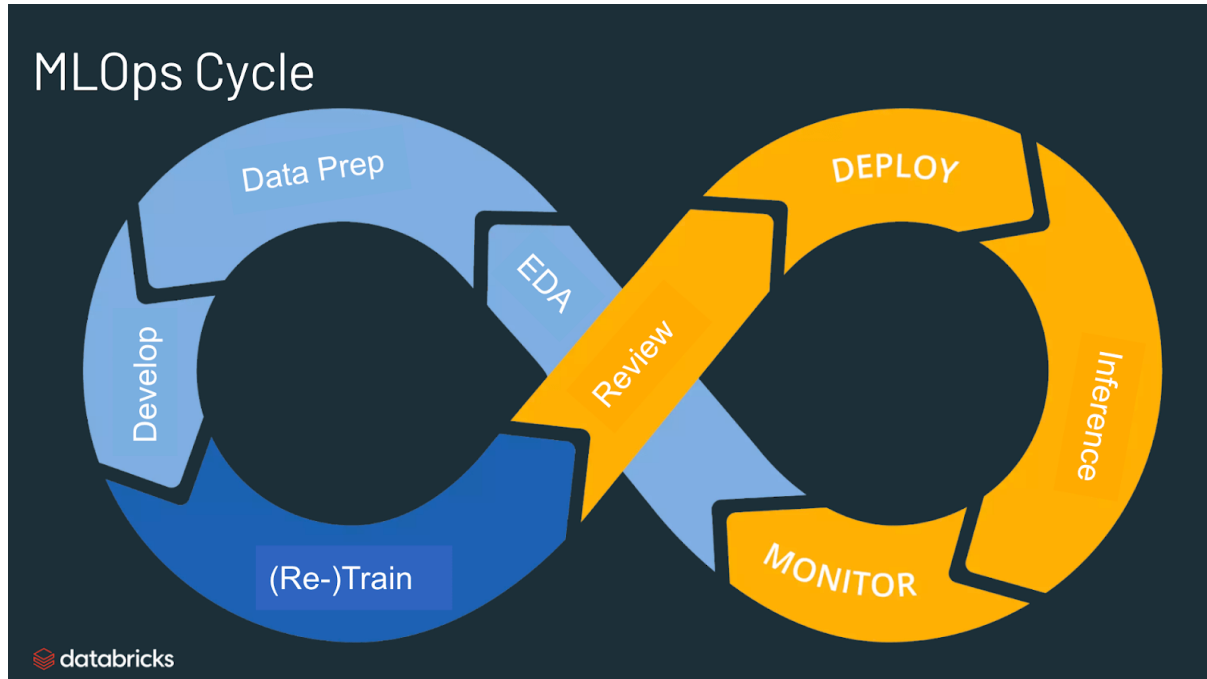

BACKGROUND

From starting a machine learning (ML) project to a model in production ...

- Acquiring data
- Transforming data into proper formats
- Running & tracking experiments
- Comparing experiment performance
- Packaging final models for deployment
- Successfully deploying models
- Monitoring live performance
- Retraining & redeploying over time

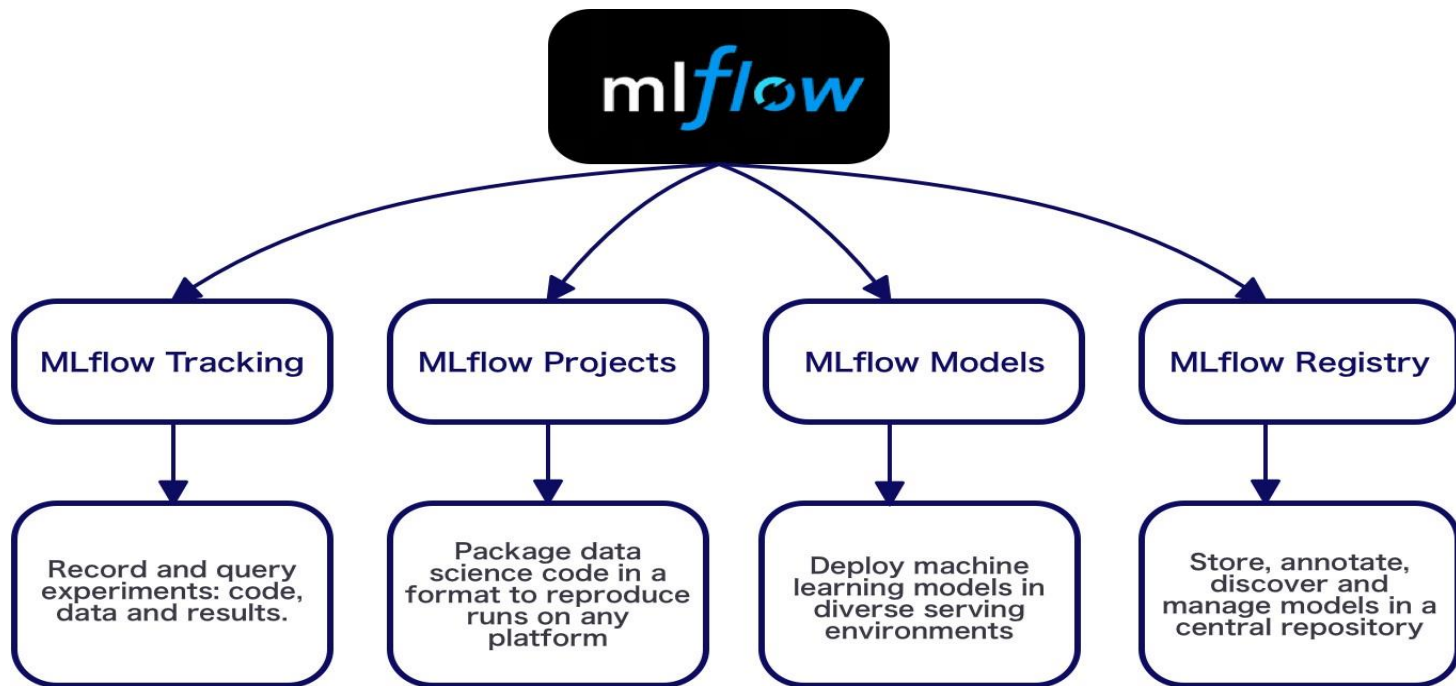

How can we streamline these steps to support reproducibility, transparency, and team collaboration?

MACHINE LEARNING OPERATIONS (MLOPS)

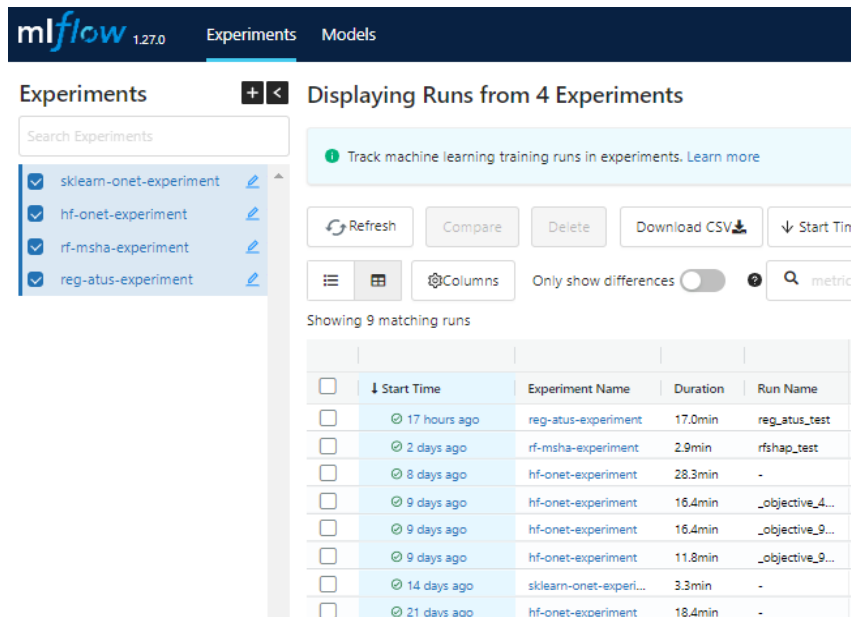

MLOps encompasses a range of best practices designed to support all stages of the ML project lifecycle.

Python Application Programming Interface (API)

```
mlflow.log_params(best_cv_params)
predicted_prob_df = helpers.force_prediction(pd.DataFrame
signature = mlflow.models.infer_signature(task_train, pre
mlflow.sklearn.log_model(cross_val, "logreg_model", conda

| | | | | | registered_model_name="sklearn_on

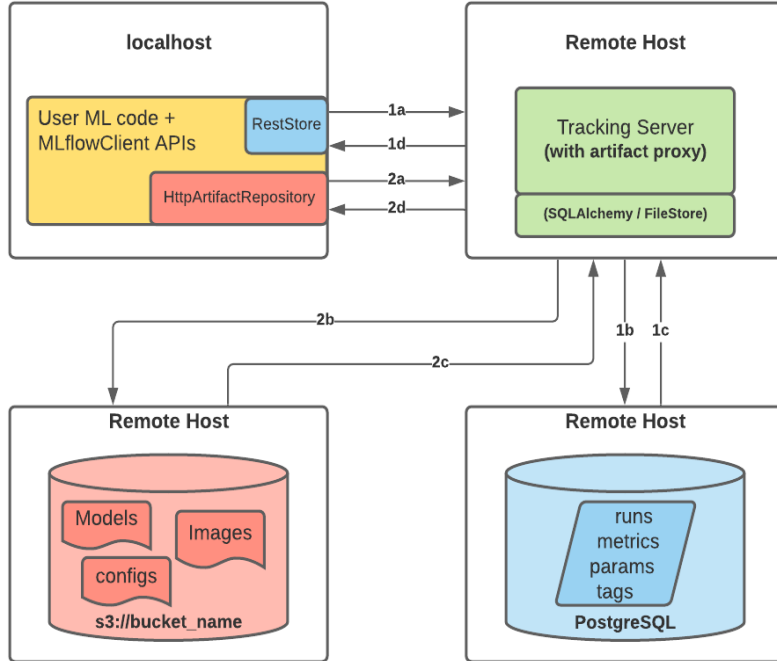

# Logging all associated metrics into Mlflow- note the arg
mlflow.log_metric("Accuracy", accuracy_score)
mlflow.log_metrics(prf_micro)
mlflow.log_metrics(prf_sample)
mlflow.log_metric("Hamming Score", hamming_score_result)
mlflow.log_metric("Hamming Loss", hamming_loss)

# Logging classification label counts figure, current not
row_sums = predicted_prob_df.sum(axis=1)
row_sum_plot = row_sums.value_counts().plot(kind='bar')
row_sum_plot = row_sum_plot.get_figure()
mlflow.log_figure(row_sum_plot, "row_sum_plot.png")
mlflow.log_artifact("sklearn_mlflow_example.ipynb")
mlflow.log_artifact("./pyfiles/helpers.py")
```

PROJECT OBJECTIVES

1. Establish a central MLflow server supporting remote access
2. Test & document MLflow's features
3. Develop example Python scripts demonstrating MLflow code integration
4. Provide guidance on MLflow's ability to support BLS data science use cases

ESTABLISHING THE REMOTE SERVER

* Not using S3 for BLS remote server

Central location to track projects & experiments

Accessible from individual work computers

Stores a range of ML project “artifacts”

- Models themselves
- Chosen model parameters
- Data visualizations
- Performance metrics
- Code files
- Project documentation

TESTING MLFLOW FEATURES

huggingface-onet-experiments > Comparing 4 Runs from 1 Experiment

Comparing 4 Runs from 1 Experiment

Visualizations

Parallel Coordinates Plot Scatter Plot Contour Plot

Parameters:

learning_rate x

Metrics:

loss x eval_f1 x eval_accuracy x

eval_roc_auc x

Clear All

Remote server UI demonstration

MLFLOW EXAMPLE CODE

6 Example Code Walkthroughs

- 5 ML libraries
- 4 unique algorithms
- 3 public data sets

Delineating MLflow integration from initial data preparation to live model deployment

3.0 Model Deployment

Now that we've successfully ran our MLflow Project and logged the model within MLflow, we can move to locally deploying our model facilitated by the `mlflow models serve` command:

```
mlflow models serve --model-uri [REDACTED]
```

The call specifies the artifact path on the remote server that houses our logged model, which can be found through this run's assets within the MLflow UI. We additionally set the local port for the deployed model to send data to to test the model's ability to generate predictions. The following output confirms that a Gunicorn local server was successfully launched that now hosts our model:

```
127.0.0.1:7000 -w 1 ${GUNICORN_CMD_ARGS} -- mlflow.pyfunc.scoring_server.wsgi:app'
[2022-07-19 11:07:13 -0400] [2669324] [INFO] Starting gunicorn 20.1.0
[2022-07-19 11:07:13 -0400] [2669324] [INFO] Listening at: http://127.0.0.1:7000 (2669324)
```

Let's send a test data sample to our deployed model to verify whether it can produce robust predictions on unseen data. Since we've integrated our text vectorizer and our logistic classifier into one live pipeline, we can send over a raw string sample through curl. Following the DataFrame format the model was trained on, we specify the column of our task text and create a previously unseen task description for the model.

```
curl -d '{"columns":["Task"],"index":0,"data":["Build and deploy machine learning models"]}'
```

If you see `[0]` following this curl call, that means the model has successfully generated a prediction on the test string. Within the example notebook this code is sourced from, the logged model is the last model out of the 37 models cycled through the one-vs-all task. We're therefore receiving a single prediction for class membership regarding this General Work Activity from the ONET data.

MLFLOW AT BLS

BLS MLflow Pilot Integration Documentation

Remy Stewart, BLS Civic Digital Fellow, Summer 2022

With the increase of machine learning applications across BLS offices, there is a growing collaboration across teams, and assist with transitioning models from experimentation to production location to facilitate the practices of machine learning operations within organizations- machine learning model lifecycles.

This documentation serves as an introduction to MLflow overall and towards its pilot applications for BLS data scientists, and tips for how to best incorporate the platform's components into Jupyter Notebooks within this repository's examples folder that offer code walkthroughs for transformer models processing three different public BLS-affiliated data sets. The mlpro scripts into production environments.

- Documenting how MLflow can best support BLS data science
- How to reproduce the remote server configuration
- Opportunities & challenges regarding MLflow for BLS use
- Future work towards scalability & comprehensive implementation

THANK YOU FOR A FANTASTIC SUMMER!

Special thanks to David Oh, Brandon Kopp, and Lowell Mason for their support of this project.
